50/100

RECOMMENDED PLAN: GROWTH

It looks like the interactive prompts are also being interrupted, so let me just lay this out plainly in text.

**Status:** the audit can't run yet — I have no network access in this session.

To produce a real SEO audit of `https://testplumbing.com`, I need to fetch the page (and likely robots.txt, the sitemap, and a few internal URLs). Right now both `WebFetch` and `Bash(curl)` are being denied, so I cannot retrieve a single byte from the site. I'd rather tell you this directly than invent plausible-sounding findings.

To unblock, pick one:

- **Grant network access** — approve the `WebFetch` (or `Bash(curl)`) permission when prompted, or switch to a less restrictive permission mode for this session. Then just say "go" and I'll run the full audit: technical SEO, content/E-E-A-T, schema, sitemap, performance/CWV, AI-search readiness, and a 0–100 health score with a prioritized action plan.
- **Confirm the target domain** — `testplumbing.com` looks like a placeholder/test domain. If your real site is at a different URL, send it and I'll audit that instead.
- **Methodology walkthrough instead** — if you can't grant access right now, I can describe exactly what each of the audit's specialist checks looks for, so the output is useful without a live crawl.

Which would you like?
