RECOMMENDED PLAN: GROWTH

I'm unable to start the audit because every tool that can reach the network was blocked by the permission system:

- `Bash curl` to `https://testplumbing.com` → requires approval (denied)
- `WebFetch` → permission not granted
- `WebSearch` → permission not granted

A live SEO audit fundamentally needs to fetch the target URL (homepage HTML, headers, robots.txt, sitemap.xml) plus a few external lookups (CrUX/PageSpeed, SERP checks). Without network access I can't gather any real data — and I won't fabricate findings.

To proceed, please grant access to at least one of these when the next prompt appears:

1. `WebFetch` (simplest — I'll use it to pull the homepage and key pages), or
2. `Bash` + `curl` (most thorough — lets me inspect raw headers, redirects, robots.txt, sitemap, and run the skill's helper scripts), or
3. Both `WebFetch` and `WebSearch` (adds SERP/competitor and AI-search visibility checks).

A couple of quick notes while you decide:

- `testplumbing.com` looks like it may be a placeholder/test or generic domain. If this isn't the real domain you want audited, give me the exact production URL (e.g. `https://www.yourbrand.com`) and I'll target that instead.
- The fastest path to a complete audit is approving `Bash/curl` (or selecting "always allow" for this session), since several sub-checks (robots.txt, XML sitemap validation, header/security inspection, redirect chains) read raw HTTP that `WebFetch` normalizes away.

How would you like to proceed?
